iW Scan Manager

Enable high-volume forms  
scanning from your Canon  
device directly into iWDM

If you need to import large quantities of data into iWDM, turn to iW Scan Manager. It's designed specifically to enable a specialist Canon DM scanner, or Canon iR device, to help you process large quantities of paper based 'forms', such as invoices or receipts, that can be batched together.

### Key benefits

- Powerful image capture and indexing functions
- Forms recognition - perfect for "structured" office documents (i.e. invoices, contracts, etc.)
- Save time indexing and filing business-critical documents
- Increased productivity in a workflow
- Tight integration with Canon hardware.

Give yourself the capability to handle large quantities of form data with iWDM and iW Scan Manager.

### Tackle forms with iW Scan Manager

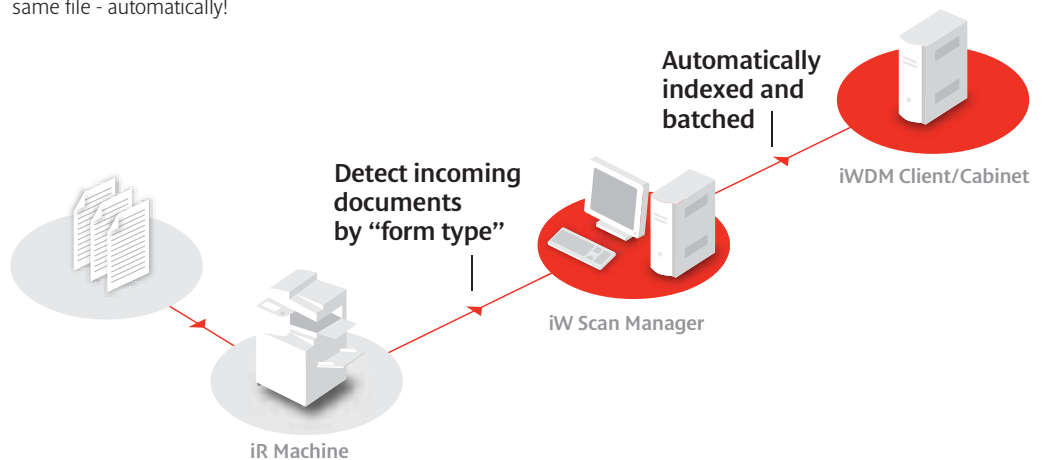

iW Scan Manager can detect incoming documents by "form type". Via pre-defined barcode, OCR and specific "area indexing", files can be automatically indexed and batched together as worksheets. This makes it a quick and highly efficient way to integrate forms into iWDM, your electronic filing system.

### Enhance efficiency using workflow

With iW Scan Manager you can incorporate a workflow into your business process to enhance efficiency. For example, scanning and indexing can be undertaken by one user, this data is then passed elsewhere for verification, prior to automatic filing within a target iWDM cabinet.

### Automatic document distribution

It's even possible to use the information within a scanned document to decide where best to file it. iW Scan Manager looks for specific words, based on rules that you establish, and uses this information to determine where to correctly file each document. So it's easy, for example, to place all orders from a particular customer in the same file - automatically!
